Twin Falls, Idaho

Part 5th NE NE 22-10-17.

Of all the drainage work done by the Twin Falls Canal Company the lands in this vicinity has furnished the most difficult problems.

The usual method of drilling wells has not produce the desired results as they discharge but little water. In fact the trenches when excavated to a depth of about 5 feet discharge more water than the wells.

The ground water is passing thru the soil at a very low velocity. The soil formation is conducive to capillarity and keeps the water near the surface.

Examination May 24 1918 shows water within 12" of the surface of most of this land. This was true immediately over the tile line.

I am of the opinion that the back filling on the tile is so thoroly puddled that water can not enter the tile. I suggest back filling immediately around the tile with gravel or cinders. Also suggest the construction of more drains approximately 100 ft. apart
